The present invention relates to a four-wheel steering system for an automotive vehicle, and particularly to a four-wheel steering system wherein a selective actuation of a pair of wheels with a common steering control signal can be selectively achieved. Conventional four-wheel steering systems are generally of two types, that is, an electrically operated four-wheel steering system and a mechanically operated four-wheel steering system. The electrically operated four-wheel steering system comprises a control device including an electric motor for providing a torque signal to a steering mechanism adapted to move a pair of wheels in a direction perpendicular to a vehicle's direction of travel. The electrically operated four-wheel steering system is advantageous over the mechanically operated four-wheel steering system because of its quickness of response, but it also requires a sophisticated electronic control device and a large electric motor, resulting in a high cost and a bulky and heavy construction. The steering mechanism generally comprises a link which is coupled to the electric motor through a torque rod and is mounted on a steering shaft such that rotation of the steering shaft is transmitted to the pair of wheels. The mechanically operated four-wheel steering system, which comprises a mechanically operated steering mechanism, generally requires a larger number of mechanical parts than the electrically operated four-wheel steering system, but is free from the disadvantages attendant upon the electrically operated four-wheel steering system described above. The mechanical operation of the steering mechanism, however, is achieved by a combination of a pinion gear and a rack gear, whereby accurate gear mesh is essential for proper operation of the steering mechanism. However, since the conventional mechanical steering mechanism comprises the pinion gear and the rack gear meshed with each other, the number of required parts is not so large and the mechanism can be readily constructed. Unfortunately, both the electrically operated four-wheel steering system and the mechanically operated four-wheel steering system are of no use because they cannot achieve a steering control operation wherein a selective actuation of a pair of wheels can be selectively achieved. The four-wheel steering systems described above have the further disadvantages that they cannot combine the advantages of four-wheel steering mechanism requiring a small number of parts and a compact, light and inexpensive construction with the characteristic of four-wheel steering system having a quick response time, and cannot make one wheel act in cooperation with the other
