When I import a file, I no longer have to scroll through my images to find the one I want, because Lightroom automatically displays that image on the second page, along with a few other images that I would like to see. It is a smart way to view images that you know you want to work on. Thumbs-up from me. The new HDR stack tool is another one that I am liking. I have found myself wanting to do HDR photography more often than not. While Lightroom 5 has not, by default, made the process of creating a subtle fine quality HDR image easier than with the previous versions, it has added a "two passes" option that allows one to quickly create and view a HDR image. Microsoft Office used to be the defacto standard of document editing on the PC back in the good old days, but then that all changed. Adobe Photoshop became the business standard and has remained so ever since. Design. In the past, I would have been perfectly happy to end this review at this point, but unfortunately the last question bring us on to the downsides of Adobe's rightly popular image management and RAW converter tool. I did say Lightroom emphasize speed, but perhaps clarifying this statement is in order. The emphasis on speed lies in the flexibility of available tools. For example, you can now do some advance image "healing" with the updated Spot Removal tool and remove objects that are more complex than simple dots. And that saves you time working with Photoshop on the same image, which I personally

appreciate very much. When it comes to the actual speed of operation, however, things havent really changed for the better. Afts you can't have some awesome thing on top of some awesome thing. Importing is, if anything, slightly slower. The same with Exporting, which also feels to be more sluggish than before. Use that brilliant Spot Removal tool too many times on too many photographs and you may experience lag when changing adjustments or moving from one image to another. Other obvious bugs and performance issues do not make a very good impression too. Of course, complex Spot removal shapes are bound to eat up those resources. After all, there is quite a bit of vectoring involved, not to mention that the image is not actually changed since Lightroom applies changes non-destructively. In essence, any adjustments you perform, including the Spot Removal tools and the Radial Filter tools, remain as descriptions that must be read by the software. Even so, I believe that a careful optimization of how computer resources are used, as well as some database tweaking should be possible. Or perhaps Adobe needs to start utilizing some in-memory database processing features that we see in enterprise-class databases and applications today. Yes, the speed of modern computers is faster than ever, but with the software getting more and more complex, I feel that Adobe should invest some time in optimizing and tweaking it. It took Adobe a while to add full 64-bit support to Lightroom and I am not sure how well it actually utilizes multi-core CPUs and caching technologies. Probably not enough, considering how slow Lightroom can get. I believe that Multi-threading should now be a part of the Export process, so that we do not have to export multiple images in batches. Perhaps the biggest consideration here, though, is the fact that we need program administrators to make sure the Lightroom application has open access to the processes necessary to move files between the various machines. Theres no way to do this on your own. Without that sort of assistance, Lightroom may slowly crawl about trying to free up resources and work on processing images. I can imagine, however, that the biggest market for this sort of functionality would be small businesses who do not necessarily require Adobe to maintain a team of administrators to keep the Lightroom uploads moving along.

The basic tools for color adjustment include an adjustment layer, a selection tool, and a settings layer. This is the most basic of photo editing and is often referred to as Duplicating Selected Areas. It involves using the Select tool to select some areas of an image, adding color, and then copying the selected areas. An adjustment layer can be used for any of these basic tools. Like other standard selections, the marquee selection tools allow you to select specific areas of an image. The options are dependent on the

size of the image. The marquee selection tools are the Rectangular, the Elliptical, and the Freehand Selection tools. They are all included in Photoshop.
