Because of its global nature, the world's greatest program for image editing is optimized for worldwide use. That's why many of the features that make Photoshop on the web so powerful also come to life in Photoshop for desktop and mobile. For instance, the Web Enhancement panel allows web designers to retouch the entire image with a single click. This is a built-in panel of adjustments that designers can use to improve just about any area of a picture, such as removing red eye, adjusting tone, or enhancing texture. Adobe hopes that the combination of the powerful selection tools and features of Photoshop Elements on the desktop with the interface enhancements in Photoshop on the web, such as the new mobile HTML5 removable object selection, will make it easier to create visually rich mobile images. This update lets users select a section of the image and create an object selection that can be moved and animated. Looking for the perfect image for the cover of a marketing campaign, a brochure, or a web page? Now you can select and add an image, then text, and apply interesting effects for presentation. The new collage command lets you easily create images using multiple, overlapping images laid on top of each other. And you can now apply those collages as a tag mask, layer mask, or Photoshop adjustment layer. When you don't want to use Photoshop's powerful selection tool, you can now remove the background. Adobe's Content-Aware Fill tool applies the most appropriate object and texture from the image to fill in the background. It's all available with just a single click.
