If you have a video on YouTube, chances are it probably won't do very well for you. Unless you have millions of subscribers -- and that's not you, right? -- YouTube videos typically don't do very well for a couple of reasons. First, it's hard to get people to watch a video. Second, even if you get a lot of traffic to your video, the vast majority of viewers will not actually click on your video, and that means your potential customers don't see your video. However, not everyone agrees with that, and a new Google project might just be the solution.

Aesthetic features like layers and paths mean there's a lot more depth to Photoshop than you might expect from a simple image editor. It's also the best-looking photo editor for the iPad, and the fact that it comes from one of the biggest names in the industry makes it feel like a true Photoshop, rather than some curio that only a true Photoshop aficionado could appreciate. For younger, less skilled artists, the flipside is that PSD files will require cumbersome file conversion, and will require you to throw out your existing art styles. But **Photoshop Quartz PDF** still isn't really the same as traditional, non-vector versions of Photoshop, and that limits what you can do with it. In theory, all you'll be able to do with it is layer a key photo onto an existing image, add text, and tweak a few settings. But given that the tools are virtually identical to those in the full version of Photoshop, you'd be better off using the full version and cutting out the PDF version after you've got the version you want. From a graphical standpoint, there are some things I miss from the full Photoshop workflow, such as the ability to manually tweak shadows, masks, and other effects. But for those who know and value Photoshop (which, really, most people who buy a new app do), its new features don't really detract from the end result, and, I think, will be largely underused. But even with the awful port to Mac, **Apple Photos on the iPad: Home** is certainly better than nothing, particularly given how badly the iOS side of **Photos** has been performing of late.
