PC hardware is nice, but it's not much use without innovative software. I've been reviewing software for PCMag since 2008, and I still get a kick out of seeing what's new in video and photo editing software, and how operating systems change over time. I was privileged to byline the cover story of the last print issue of PC Magazine, the Windows 7 review, and I've witnessed every Microsoft win and misstep up to the latest Windows 11. The only major gripe I have left is with the review process itself. All you need to do is take a step back and look at the big picture. You can make your own assessment for yourself from now on. While your workflow is slightly crunched and a few shortcuts are missing to really streamline the editing process, it's clear why so many professionals are still sticking with Photoshop. The AI improvements are even better than I would have expected, so there's less reason to use the less powerful Lightroom. The fact that it performs so well is more than

enough for me, and the price is also enough to keep me using Photoshop, even though I'm in the process of moving. *By now, every tech blog has covered AVN's use of crowdsourcing to screen films , with reporters at every major exhibitor and online streaming service. We even just published an in-depth analysis of the phenomenon. The bottom line is that the future of art and commerce are intertwined, and screening rooms such as those used by Amazon and Aereo (which has been in the news over the past few years) are necessary if film exhibition is going to continue as it does today. As we've discussed previously, online streaming services (even Netflix—who is a member of the Motion Picture Association and who was actually one of the first companies to do this with its own streaming platform) are not the future.*

Adobe applications can be very taxing on any computer and more RAM helps to complete those tasks quickly. Having more RAM connected to your processor will ensure you have a highly optimized powerhouse computer to handle any and all Photoshop tasks. Ever since I was able to afford my own computer, I never purchased a computer with less than 16GB of RAM. Most computers nowadays come with at least 8GB of RAM which is sufficient. The one nice thing about RAM unlike a processor is that you can replace the RAM and add more after purchasing it. However, make sure to check this as again, companies like Apple have made it impossible to replace the RAM in their computers. It is always worth double checking!
