- Open Office. Microsoft's open-source office suite, which is widely used among professionals worldwide, has received a new version using the new native APIs. The next release of Open Office, version 4, will be based on the new APIs available in macOS. Because professional users often use Microsoft Office simultaneously with their open-source alternatives, it's important that the change to Photoshop/Elements/Actions/Brushes features live through all these applications - so you can move files seamlessly between them. - Viewer. When nested files are dragged into an open document, the names of high-resolution files are only sent when applied. This speeds up opening time and allows resizing the entire document to the dimensions of another file. - Support for 64bit. The software automatically adapts to 64bit systems, so users don't have to worry about this. Where insufficient memory or system power resources have prevented users from using a 64bit system, then Photoshop Elements would now also be available for it. This new status quo means that Adobe Photoshop will no longer require the use of third-party plugins for many of the features found in Adobe Lightroom. In fact, many Lightroom features, including importing photos, importing PDF files, gestures, and the library, will now be native to Photoshop in the future. Adobe also states that the new Photoshop content model has made it easier to maintain the performance of undo and redo for complex high-resolution files. The biggest change however is the combination of the new multitasking and memory style APIs on macOS and offline file support, which promises improvements in performance, memory and file handling.
