Pixelapse is a reliable service for online file storage, as well as a desktop program that facilitates file sharing from your computer to the specific cloud account. Pixelapse is a tool capable of helping you setup project development and team cooperation, while offering a comprehensive and user-friendly work environment. Simple to use desktop application Similar to other file sharing applications, Pixelapse creates a special folder on your computer, one that you can easily relocate to a preferred location. Thus, all the files that you move into that particular folder are instantly sent to the online account, where they can be viewed and managed by a series of authorised users. The software facilitates file synchronizing, but it also stands as a useful tool for quickly sharing projects with other team members.

All files updated to the cloud account are sorted by the date they were added, for easy identification. The desktop application allows you to keep track of the file sync progress, indicates the amount of space left on the storage area and enables you to pause/resume the syncing at any moment. Online sharing and team work Each project you create online is reflected on your desktop by a sub-folder in the Pixelapse directory. What's New In Pixelapse?

Pixelapse is a simple, clean and professional file synchronization and sharing tool for designers. It enables you to organize and develop projects online and in real time, plus it makes project sharing and collaboration a piece of cake. When you first open Pixelapse, you are immediately greeted with a list of available accounts and a dashboard with your current project. There are no tabs for choosing which projects to synchronize, however. Instead, you should add new projects or file in the

ones that you have already created. You cannot add projects directly from your desktop, however, so you need to start the software. After you start Pixelapse, you are automatically presented with a list of available accounts and a dashboard that shows the files of your current project. The list includes folders that were added to the accounts and the amount of space they are currently occupying. The space can be allocated to any folder and it can be used to keep track of how much space you have remaining. The dashboard will also show you the list of files in your current project. Pixelapse supports many file formats and types, including bitmap, vector, audio, video, front end (CSS, HTML, JS, JS, and MD), as well as documents. It also has the ability to synchronize files on multiple accounts. Pixelapse also lets you manage files and folders for each account separately. This is helpful, because it lets you add files, organize them and add folders for

each account. It's also easy to move your files around between accounts. Pixelapse's Project Development tools are also useful. It provides you with a dedicated menu item for adding new files to your projects. When you create a file in the application, it is automatically placed in a folder that is created for your project. This folder can be renamed at any time. If you change the name, the folder will be deleted and a new folder with the new name will be created. Files and folders can be organized using a simple file system, too. Pixelapse has the ability to show all of your folders and files in the file list. This allows you to easily organize your projects and manage your files. Pixelapse is designed to work without requiring any interaction from you. The program is ready to work, and you can begin your file sharing immediately. However, you can also download and install an app extension for Chrome. The Pixelapse app is for Windows.
