This database stores macro definitions with the relevant node id, definition, parameter (optional), macro properties (optional) and the parsed result of the macro (optional). KEYMXNDescriptions: A description is a textual definition of a node. It includes properties such as class, parts of speech, gloss, paraphrase, synonyms, context, data base, etc. KEYMXNComponentDescription: A component description is a textual description of a component (e.g., paragraph, list, gloss, etc.). It can also include properties (e.g., class, parts of speech, paraphrase, etc.). KEYMXNAttributes: An attribute description is a textual description of an attribute (e.g., evidence, biological) that is attributed to an entity. KEYMXNParameters: A parameter is a phrase, word or phrase (e.g., modifier, modifier of modifier, etc.) that describes how the given word is used within a node. KEYMXNProperties: A property description is a textual description of a property. A property can describe multiple properties (e.g., multiple parts of speech or multiple instances). KEYMXNParsedResult: A parsed

result description is a textual description of the parsed result of a keyword or phrase. It can be a list of strings, keywords, or phrases. NEW YORK (CNNMoney) -- With American workers facing layoffs and the economy suffering through another difficult year, it's hard to blame people for wondering, "What's going to happen to me?" "We've heard people say they want to be able to offer their employees better health care or better working conditions, and they want to be able to have pension plans, and they don't want to be worried about having a job," says Michael Patrick, the vice president of the labor law and public policy group at the American Benefits Council, a trade association that represents major employers. But the tax code also offers Americans an incentive to keep their jobs, or at least not lose them. "With regard to healthcare and working conditions and pensions, they don't do that," Patrick says. "They do that by recognizing that an employee's contribution to their 401(k) or pension plan is deductible.... They do that by recognizing that as long as they're paying at least 7.65% (the minimum federal income tax rate) in each of those quarters, they can deduct it." When workers contribute to their retirement plans, it can reduce the amount of taxes they owe and lower the cost of their retirement. So the question is: Should companies help their workers, and why don't they already? Related: Why aren't companies giving more money to employees? The short answer is because that's the law. The federal government's tax code allows workers to deduct from their taxable income the money they contribute to their retirement savings. Workers can put that money either into a defined-benefit retirement plan like a 401(k), or a defined-contribution plan like a traditional IRA or a Roth IRA. The money they contribute is called pretax or before-tax money. When an employee's taxes are calculated using the pretax money, the employer is getting a tax break. But when an employee's taxes are calculated using the after-tax money, the employer is paying a higher tax rate. Employees have the right

What's New in the ExtJWNL (Extended Java WordNet Library)?

extJWNL is a module for Java (Java 1.4 and later) that allows for reading and editing dictionaries in the WordNet format. This library provides several additional functions for dictionaries, making it useful for storing the contents of the complete WordNet dataset. The library provides a large set of main methods for creating and loading new dictionaries and for making queries to the WordNet

dataset as well as several utility classes for working with WordNet data. Usage: To create a new dictionary from the database, use the createDict method and specify the appropriate arguments. The arguments describe the database version, the database index, the minimum word count, and other values to be used in the creation of the dictionary. To read a previously created dictionary, use the loadDict method. This method opens the dictionary database in read-only mode and returns the Dictionary object. To update the dictionary, you must first close the database with closeDict and then use the saveDict method to save the new data to the dictionary database. Distribution: The distribution of this library includes the extJWNL.jar file, the optional extWnB.jar file, and the WordNet data. All of the required data is included in the distribution file. You should not have to download any additional files to use this library. The files are included for easy distribution and handling with the package manager for the program in which the library is used. Changes: The library is released under the GNU GPL v2 license. You may find earlier versions of the library on the WordNet Web site. Installation: To use this library you must have a version of the Java Runtime Environment (JRE) installed on your computer. The version of JRE required for the library is 1.4 and higher. If you do not already have a copy of the JRE, you can download it from You may install the JRE anywhere on your computer, as long as you have sufficient disk space to create the library. You can download the JRE from any of the Sun Microsystems Web sites (Notes: This library does not depend on any other library. All of the dependencies are included in the distribution package. It uses other Java classes from the Java API and the AWT for performing some of its functions. For information on using the AWT, refer to the AWT User's Guide.
